

Introduction to Machine Learning

Machine learning is a branch of artificial intelligence that allows computers to learn patterns from data and make predictions or decisions.

Supervised Learning: The model learns from labeled data. Common algorithms include Linear Regression, Decision Trees, KNN, and Support Vector Machines.

Unsupervised Learning: The model finds patterns in data without labeled outputs. Clustering is a common example.

Training: A machine learning model learns patterns from a training dataset.

Prediction: After training, the model can use new data to produce predictions.

RAG Practice: This PDF can be loaded into a Retrieval-Augmented Generation pipeline. You can split the document into chunks, create embeddings, store them in a vector database, retrieve relevant chunks, and use them as context for an LLM.
